Submitted (23-0CT-2003) Balzergue S., UMRGV, INRA/CNRS, 2 rue gaston Cremieux, 91057 Bvry cedex, FRANCE PCR was performed on DNA from transforments of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequence from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (http://www.genoplante.com and http://genoplante-info.infobiogen.fr).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to a new compound having a sequence comprising 8-50 bp targeted to a nucleic acid encoding human collapsin response mediator protein 2 which specifically hybridizes with the nucleic acid encoding human collapsin response mediator protein 2 and inhibits its expression. The compound is useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease, Down syndrome or schizophrenia. This sequence represents the human collapsin response mediator protein 2 gene intron 1 sequence against which the antisense oligonucleotides may be targeted.
                                                                                                                                                                                                                                                                                                                        New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human collapsin response mediator protein 2 gene antisense oligo #138027.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Location/Qualifiers

The invention relates to a new compound having a sequence comprising 8-50 bp targeted to a nucleic acid encoding human collapsin response mediator protein 2 which specifically hybridizes with the nucleic acid encoding human collapsin response mediator protein 2 and inhibits its expression. The compound is useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease, Down syndrome or schizophrenia. This sequence represents the human collapsin response mediator protein 2 gene intron 1 sequence against which the antisense oligonucleotides may be targeted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human collapsin response mediator protein 2 gene antisense oligo #138024

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a new compound having a sequence comprising 8-50 prargeted to a nucleic acid encoding human collapsin response mediator protein 2 which specifically hybridizes with the nucleic acid encoding human collapsin response mediator protein 2 and inhibits its expression. The compound is useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimers's disease, bown syndrome or schizophrenia. This sequence represents the human collapsin response mediator protein 2 gene intron 1 sequence against which the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human collapsin response mediator protein 2 gene antisense oligo #138025.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 neuroprotective; nootropic; neuroleptic; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a new compound having a sequence comprising 8-50 bp targeted to a nucleic acid encoding human collapsin response mediator protein 2 which specifically hybridizes with the nucleic acid encoding human collapsin response mediator protein 2 and inhibits its expression. The compound is useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease, Down syndrome or schizophrenia. This sequence represents the human collapsin response mediator protein 2 gene intron 1 sequence against which the antisense oligonucleotides may be targeted.
                                                                                                                                                                                                                                                                                                                         New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human collapsin response mediator protein 2 gene antisense oligo #138026
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "contains phosphorothioate internucleotide
linkages, all cytidine nucleotides are 5-methylcytidine
residues"

                                                                                                                                                                                                                                                                                                                                                New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a new compound having a sequence comprising 8-50 bp targeted to a nucleic acid encoding human collapsin response mediator protein 2 which specifically hybridizes with the nucleic acid encoding human collapsin response mediator protein 2 and inhibits its expression. The compound is useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease, bown syndrome or schizophrenia. This sequence represents the human collapsin response mediator protein 2 gene intron 1 sequence against which the antisense oligonucleotides may be targeted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human collapsin response mediator protein 2 gene antisense oligo #138029.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neuroprotective; nootropic; neuroleptic; gene therapy;

New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                   The invention relates to a new compound having a sequence comprising 8-50 bp targeted to a nucleic acid encoding human collapsin response mediator protein 2 which specifically hybridizes with the nucleic acid encoding human collapsin response mediator protein 2 and inhibits its expression. The compound is useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease, Down syndrome or schizophrenia. This sequence represents the human collapsin response mediator protein 2 gene intron 1 sequence against which the antisense oligonucleotides may be targeted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primer; microsatellite marker; barley; chromosome 7 marker; cereal; fermentability; group 5 chromosome; ethyl carbamate production; Bmac2l3; wort fermentation; Triticeae; Bmac96; epi-heterodendrin production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening cereals for fermentability, especially useful in barley.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                             The invention relates to a new compound having a sequence comprising 8-50 bp targeted to a nucleic acid encoding human collapsin response mediator protein 2 which specifically hybridizes with the nucleic acid encoding human collapsin response mediator protein 2 and inhibits its expression. The compound is useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease, bown syndrome or schizophrenia. This sequence represents the human collapsin response mediator protein 2 gene intron 1 sequence against which the antisense oligonucleotides may be targeted.
                                                                                                                                                                                                                               New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating neurodegenerative disease, e.g., Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human collapsin response mediator protein 2 gene antisense oligo #138030
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   neuroprotective, nootropic, neuroleptic, gene therapy,

This sequence represents a PCR primer for a barley chromosome 7

microsatellite marker, and can be used in the method of the invention.

The method is for screal for fermentability, comprising

analysing cereal genomic DNA to determine which allele(s) of a gene/gene

complex affecting fermentability at a locus close to the centromere on

bomologous Triticeae group 5 chromosome (barley chromosome 7) is/are

present. The invention also relates to a method for screening cereal for

chyl carbamate production on wort fermentation and distillation,

comprising analysing barley genomic DNA to determine which allele(s) of

the locus, designated eph on the short arm of homologous Triticeae group

che locus, designated eph on the short arm of homologous Triticeae group

che locus, designated eph on the short arm of homologous friticeae group

che locus, designated eph on the short arm of homologous friticeae group

che locus, designated eph on the strangement in methods and

primers are useful for determining fermentability and/or epi-heterodendrin

comprision in cereals, especially barley. Current methods for determining

fermentability are difficult to apply within barley breeding programs.

Prior art methods using molecular markers have difficulty in detecting

antisense oligonucleotides targeted to nucleic acids encoding A disintegrin and metalloproteinase 10 (ADAM10), useful for treating diseases associated with ADAM10 expression, e.g. inflammation or hematologic malignancies, Claim 1; Col 41-42; 29pp; English.

The invention provides antisense compounds targeted to the nucleic acid molecule encoding A disintegrin and metalloproteinase 10 (ADMA10). The antisense compounds specifically hybridize with and inhibit the expression of ADMA10. The antisense oligonucleotides are useful for treating or diagnosing an animal, particularly a human, suspected of having or being prone to a disease or condition associated with expression of ADMA10, e.g. connective tissue disorders, inflammation or hematologic malignancies. The antisense oligonucleotides are also useful

```
The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where the compound specifically hybridises with and inhibits the expression of PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a compound of 8-50 nucleobases in length which specifically hybridises with an 8 nucleobase portion of an active site on a nucleic acid encoding PTP1B; (2) inhibiting the expression of PTP1B in cells or tissues or complition associated comprising contacting the cells or tissues with the compound; treating an animal having or suspected of having a disease or condition associated sugar levels in an animal comprising administering the compound; (5) preventing or delaying the onset of a disease or condition associated preventing or delaying the onset of a disease or condition associated correcting or delaying the onset of an increase in blood glucose levels in an animal comprising administering the compound; and (6) preventing or delaying the onset of an increase in blood glucose levels in an animal comprising the compound. The compound is used
                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protein phosphatase 1B (PTP1B)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTPIB.
in research applications for the modulation of ADAM10 expression. The present sequence represents an antisense oligo specific for the human ADAM10 mRNA

to inhibit the expression of PTPIB in cells or tissues, to treat or prevent or delay the onset of a disease or condition associated with PTPIB, such as type 2 diabetes, obesity, cancer (especially ovarian cancer. Chronic myeloid leukaemia and hyperproliferative diseases in an animal having or suspected of having the disease or condition, and for decreasing blood sugar levels or preventing or delaying the onset of an increase in blood glucose levels in an animal. The compound is also used in diagnostics, therapeutics, prophylaxis, and in research reagents and ktts. The present sequence is an antisense compound of the invention targetting human PTPIB

Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.

The present invention describes a method (M1) for designing capture oligomucleotide probes (I) for use on a support to which complementary oligomucleotide probes (I) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents or Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Troptococcus neoformans, Candida albicans and Aspergillus funigautus, viruses e.g. T-cell lymphocytotrophis cirus, Espstein-Barr virus and polio virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the

Novel compound hybridizing with nucleic acid molecule encoding CD81 and inhibiting the expression of CD81, useful for treating infections and disease associated with expression of CD81 such as inflammation disorder.

cancer is specifically associated with a gene selected from BRCAl gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonuclectide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences.                  The invention relates to a compound (antisense oligonucleotide) hybridising with the eighth nucleobase portion of an active site on a mucleic acid melecule encoding CDB1 (also known as TAPA-1, a tetraspania) and inhibiting the expression of CDB1. Also included is a composition comprising the antisense oligonucleotide and a carrier or a diluent. The antisense oligonucleotide is useful for inhibiting the expression of CDB1 in cells or tissues. The antisense oligonucleotide is useful for treating infections preferably viral, bacterial and parasitic and diseases such as inflammatory disorders and autoimmune disorders. The disease or condition is characterised by chemical dependency (e.g. cocaine addiction). The present sequence is a CDB1 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Compsn. contg. sequence specific glyco-conjugate DNA ligand - for modulating gene transcription, e.g. to induce immunosuppression, does not cause DNA cleavage, also new ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New glycoconjugates are able to modulate transcriptional activity of specific genes in eukaryotic cells by selectively inhibiting binding interactions between DNA-binding proteins and their recognition sites. Glycoconjugate DNA ligands which preferentially bind to an NFAT recognition sequence as compared to an API or Spl sequence are preferred. Such ligands inhibit NPAT-DNA complex formation or displace pre-formed complexes and are useful for inducing immune suppression. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nuclear factor of activated T-lymphocytes; NFAI; interleukin 2; transcriptional regulator; early activation gene; glycoconjugate; calicheamicin-MG; purine-rich core sequence; immune suppression; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Putative NFAT binding site from human IL-2 gene (-289 to -270).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of identifying an immunosuppressive agent which comprises contacting a cell containing or capable of expressing NF-ATC and NF-ATD with one or more compounds that induces nuclear translocation of NF-ATC and NF-ATD. The method is useful in determining or controlling the expression of early T lymphocyte cartivation genes and the expression of selected constitutive genes that can be advantageously expressed in T lymphocytes. Agents that modulate the nuclear import of the cytoplasmic subunit of NF-AT or the induction of the cytoplasmic subunit of NF-AT or the induction.

The NF-AT polymucleotides may be used for diagnosing pathological conditions or genetic diseases involving T cell neoplasms or T cell hyperfunction or hypofunction, and conditions or diseases that involve alterations in the structure or abundance of NF-ATC polymptide.

Conditions or Apportmention, and sonditions or diseases that involve alterations in the structure or abundance of NF-ATC mcNA to diagnose a disease and for forensic identification of individuals, e.g. for the cidentification of descendents, paternity or criminal identification. The present sequence represents an NF-AT DNA binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    o

```
fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 89 identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and polypeptides can be used to screen for their specific interactive modecules.

Cond/or prognosis of these diseases. The nucleotides and polypeptides can also be useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent critis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34884- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New radiation hybrid map of the dog, Canine familiaris, genome, useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primers AAZ01426-Z06209 were used to amplify open reading frames cocke by the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases unch as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis, genital diseases such as nongonococcal uretritis, pendydmitis, cervicitis, salpingtitis, perihapatitis, bartholinitis, peneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

for e.g. identifying genes implicated in phenotypic and behavioral traits or in genetic diseases and for studying dog pedigrees.
                      Claim 1; Page 55; 87pp; English.
```

The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types of the dog genome and provides a dense map integrating different types (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify marked genes, to analyse diseases and identify implicated genes in such diseases and to analyse and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes Sequence 20 BP; 9 A; 2 C; 6 G; 3 T; 0 U; 0 Other; involved in genetic diseases

Pharmaceutical composition for treating ailments associated with impaired ö respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone

Disclosure; SEQ ID NO 9221; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions,

```
James 2 introversion junctions, or regions within a club collections of punctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention of the invention and antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a consenting a respiratory lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antistant servicid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung aurfactant in a subject's tissue, or treating bronchoconstriction, note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

Novel Herpesviridae thymidine kinase mutant useful for inhibiting pathogens e.g. viruses, bacteria, tumor in animals, has one or more mutations encoding amino acid substitutions upstream from the DRH nucleoside binding

Example 9; Col 47; 78pp; English

```
The invention describes an isolated Herpesviridae thymidine kinase (TK) comprising a 12 amino acid (aa) nucleoside binding region having a site 3 made up of a DRH nucleoside binding site and a site 4 and mutation(s), at least one of the mutations being an a substitution 2 or 3 aa upstream or 5 or more as downstream from the DRH motif that increases a biological activity, preferably ability of TK to phosphorylate a nucleoside analogue, as compared to unmutated TK TK mutants are useful for inhibiting a pathogenic agent such as viruses, bacteria, parasites, tumour cells or autoreactive immune cells in a warm-blooded animal. TK mutant is useful for inhibiting a tumour or cancer in a warm-blooded animal. (or treating a variety of disease e.g., hyperkeratosis (psoriasis), prostate hypertrophy, hyperthyroidism, endocrinopathies, autoimmune diseases, lalexipes, restenosis, viral diseases such as acquired immunodeficiency syndrome (AIDS) hepatitis (HCV or HBV), intracellular parasitic diseases, and to correct aberrant expression of a gene within a cell, or to replace a specific gene which is defective in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                 proper expression using gene therapy, e.g. including adenosine deaminase deficiency, and Alzheimer's diseases. The mutants are utilised as a conditionally lethal marker for homologous recombination. This sequence

Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL mas two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL startes an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome lDpl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorders associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, and cotal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful disorder: The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide which down regulates expression of Ets-related gene,

conditions selected from cancer, lynphoma, Ewing's sarcoma, melanoma, theory and in the cancer, lynphoma, Ewing's sarcoma, melanoma, theory and conditions selected from cancer, lynphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, variation, architis, psoriasis, verruca vulgaris, angiofibroma of tuberous solerosis, port-wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukemia, osteoporosis and wound healing. [1] is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with [1] under conditions suitable for the treatment. Leukemia or tumour the reatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukemia or tumour conditions suitable for the treatment. Leukemia or tumour conditions with one or more of other therapies such as radiation or chemotherapy treatment. [1] is useful for reducing ERG activity in a coll. by contacting (1) with RNA, in the pateence of a divalent cation such as Mg2+. [1] is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations with RNG and as diagnostic tool to the presence of ERG RNA in a cell. [1] is useful for specifically cancering genes that share homology with ERG gene or ERG fusion genes. ABKI7319 represent nucleic acid molecules which regulate expression of ERG, and enarmatic nucleic acid molecules acid significance of ERG, and enarmatic nucleic acid molecules acid significance of ERG, and enarmatic nucleic acid molecules acid significance of ERG, and enarmatic nucleic acid molecules acid significance of ERG, and enarmatic nucleic acid molecules acid cide enarmatic nucleic acid molecules acided enarmatic mucleic acid molecules acided enarmatic nucleic acid molecu The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome. Claim 4; Page 69; 149pp; English.

ö New isolated or recombinant polypeptide for use in modulating a plant growth trait in a flowering plant e.g. in Arabidopsis, Brassica, Zea, Oryza.

English NO 205; 81pp; 2; SEQ ID Example

The invention describes an isolated or recombinant polypeptide (I) the invention describes an isolated or recombinant polypeptide (I) the specification, or a conservative variant; (b) encoded by 1 of 30 sequences (S2), as given in the specification, or a conservative variant; (c) encoded by a sequence that hybridises under stringent conditions to S2; and (d) encoded by a sequence to \$\frac{1}{2}\$ independent of \$\frac{ primer, probe or genetic marker.

Sequence 17 BP; 6 A; 5 C; 1 G; 5 T; 0 U; 0 Other;

Human glial cell derived neurotrophic factor and its derivatives and use. Claim 6; Page 3 (Claims); 28pp; Chinese. The invention relates to the human glial cell derived neurotrophic factor (GDNF) and its derivatives and use. The invention also relates to a method of obtaining DNA encoding human glial cell derived neurotrophic factor or its active segments and a method of purifying and fining coarse GDNF. A composition comprising human glial cell derived neurotrophic factor and a medicinal acceptable carrier can be used in the treatment of

The protein of the invention has cytostatic activity. The polynucleotide may have a use in gene therapy. The methods and compositions of the present invention utilising the EPSTI1 gene are useful for the diagnosis and prognosis of cancer, in particular metastatic cancer of the breast, placenta, lymphoid tissue, ovary, testis, thymus, lung, stomach, small intestine, colon, pancreas, spleen, skin or extracellular body fluids. The oligonucleotides are used in the treatment of the above. The sequences shown in ABZ75438-ABZ75457 represent splice donor/acceptor sites at the exon boundaries of

Representative examples of ribozyme recognition sites are given in AAA88215 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and dispostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

Homo sapiene Synthetic.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MME), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, erratological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, coptibalmological, vulnerary, keratolytic and vincide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and some and in the Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases. capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with conditionable activity from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepptic actives and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NAC with RNA-cleaving activity that modulate expression of the Raf gene, are consect to treat cancer, restences, psoriasis or rheumatoid arthritis, or used to treat cancer, restences, with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and context and processed with the level of c-raf. Introduction associated with the level of c-raf. Introduction context of an expression of the cataly any condition associated with the level of c-raf. Introduction approximately and processes are activity. ANYOSO22 to AANYOSATY represent NACS that can be used in the context of an expression of the catalogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying new catalytic nucleic acid that modulates selected processes -especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  activity. AAV90922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method has been developed for the identification of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human ERG hammerhead ribozyme target sequence, Seq ID No 554.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10.3%; Score 13.4; DB 1; Length 17; 60.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Amethod has been developed for the identification of a nucleic acid
capable of modulating a process in a biological system. The method
comprises: (a) introducing into the system a random library of nucleic
acid catalysts (NAC) having a substrate binding domain (SBD), comprising
acid catalysts (NAC) having a substrate binding domain (SBD), comprising
acid catalysts (NAC) having a substrate binding domain (SBD), comprising
acid catalysts (NAC) having a substrate binding domain (SBD), comprising
at least part of the SBDs in such systems. Nucleic acid molecules with
conditions activity, and catalytic activity, from the present invention,
are used to modulate gene expression in plant and mammalian cells and to
cleave target nucleic acid, particularly for treating systemic diseases
caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepstic
ascites and infection. They may also be used to detect genetic drift and
untations in diseased cells and to determine craf RNA. Specifically NACs
with RNA-clearing activity that modulate expression of the Raf gene, are
used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
cused to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
cused to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
cused to treat modifications increases stability against nuclease and
activity. AAV90922 to AAV38377 represent NACs that can be used in the
customy appearance of supering the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; c-raf; A-raf; B-raf; hammerhead ribozyme; hairpin ribozyme;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, conditions selected from cancer, lymphoma, arthritis, psoriasis, verruca tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca continue, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or callon such as Mg2+. (I) is useful for reducing ERG activity in a cell, by contacting the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RMA in a cell. (I) is useful for claving such as the stare homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and cargatical propertion of the expression of ERG, and expression of ERG, and enzymatic nucleic acide which regulate expression of ERG, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-hybridization assay.

Claim 2; Page 25; 117pp; English.

Detecting mutations associated with anti-HIV drug resistance comprises

```
The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/I/L, V18IC/I, M184V/I, V18BL, G190A/S/R, T215Y/F/D/S/A and/or C151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/I/L, X181C/I, O151M/L, M184VI, Y188L, G190A/S/R and/or T215Y/F/D/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable and precise assay or determination and monitoring of a rapid, and probes which are used in the exemplification of the present in the present in the area of the present in the area of the present in the semplification of the present in the semplification of the present in the area of the present in the semplification of the present in the semination in the exemplification of the present in the seminary in the seminary in the exemplification of the present in the seminary 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 17 BP; 6 A; 3 C; 5 G; 3 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention

Oligonucleotides the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel acyclic linker-containing oligonucleotide useful for preventing decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Damha MJ,
The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K1030/R, V1064/I/L, V181C/L, M184V/I, V181BL, C190A/S/R, T215Y/F/D/S/A and/or C151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes optimised to function together in a reverse hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, C106A/I/L, V131C/I, O151M/L, M184V/I, Y188L, G190A/S/R and/or T215Y/F/D/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of a rapid, rallable and precise assay or determination and monitoring of a rapid, rallable successive mutations associated with drug resistance of antivitation and monitoring of viruses containing RT genes. ABZ34542 represent HIV RT sequences and probes which are used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2'F-ANA antisense oligo #8, to elicit RNase H degradation of target RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse translation and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present
                                                                                                                                  degradation of target RNA. This sequence is used in the exemplification
They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RMsse (ribonuclease)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /*tag= a

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/I/L, Y181C/I, M184V/I, Y18BL, C G190A/S/R, T215Y/F/D/S/A and/or Q151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes optimised to function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in viro detection of the mutations K103N/R, C106A/I/L, Y181C/I, Q151M/L, M184V/I, Y18BL, G190A/S/R and/or C151SY/F/D/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable such are used in the exemplification of the present exemplification of the present
                                                                                                                                                                       ö
sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human immunodeficiency virus; HIV; reverse transcriptase; RT; enzyme; detection; mutation; anti-HIV drug resistance; polymorphism; resistance;

AAT80036-T80041 represent amplification primers for the alpha2 integrin coding sequence. The primers represented in AAT80030-T80035 are used for the amplification of the alpha1 integrin coding sequence. These sequences can be used in the method of the invention. The method of the invention of a mammal having, or at risk of devaloping, is for the identification of a mammal having, or at risk of devaloping, and and a contain cells expressing integrin RNA or protein for integrin subunit expression. The integrin subunit expression in the ample is then compared with a control tissue sample, where altered integrin subunit expression is correlated with glomerulopathy. The method can be modified to identify a mammal with diabetes who has, or is at risk of developing, secondary pathological changes associated with diabetes. An increase in alpha1 expression is diagnostic of increased risk of nephropathy. The methods can be used to determine if patients are likely to develop severe nephropathy and to monitor progress of disease during treatment protocols
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detection of nephropathy in mammals - by comparing integrin subunit expression in a tissue sample compared to a control tissue sample.

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and (c) calculating a cell; (b) determining a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell; its characterising cells, e.g. for determining the origin of a cell; its cransformed. They can be used for determining the origin of a selected treatment on a test cell. They can also be used for effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected con the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enazyme genes, steroid receptor protein phosphatase genes, P450 enazyme genes, steroid receptor con protein phosphatase genes, P450 enazyme genes, steroid receptor
                                                                                                                                                                                                                                                             Genetic proximity; gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.

```
cells. The method for determining the genetic proximity of a first cell and a descond cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell; its genetic status, whether it carries a genetic defect, or whether it is can individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired of superior (RT-PCR) for determining the pattern of gene expression in a selected con the RT-PCR reactions to determine the pattern of gene expression. The gene family. Sequences AAZ17803-Z18342 represent primers that can be used to the teamily can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, strong cenes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell the pattern cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the method expression of genetic status, whether it carries a genetic defect, or whether it is cannot cannot not be used for determining the an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptuses polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used to the RF-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox spenses, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

the human integrin beta 3 gene, which inhibit its expression. The attiseme obligonucleotides were designed to target different regions of the human integrin beta 3 RNA, and were analysed for their effect on integrin beta 3 RNA, and were analysed for their effect on integrin beta 3 RNA levels were measured as a control.

CG (glyceraldehyde-3-phosphate) RNA levels were measured as a control.

CI Integrins constitute one of four call migration, cell anchorage to and play an important role in cell migration, cell anchorage to cation-dependent membrane algoniting pathways. They are heterodimeric cation-dependent membrane (algorithms continuity in the grin beta 3 (sinck known as human endothelial glycoprotein, cation-dependent membrane (algorithms to beta subunit partner of the members of the beta-3 subfamily of integrins.

CT his family consists of the virronectin receptor (alpha-V-beta-3) and the fibronectin receptor (alpha-IIb-beta-3). Cells expressing this class of integrin can adhere to various matrix proteins and participate in various cycoadhesion-driven cellular responses. Integrin beta 3 is implicated in conditions such as vascular restenosis, excessive bone resorption, and conditions such as vascular restenosis, excessive bone resorption.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 8s; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  angiogenesis (in melanoma), tumour invasion, platelet aggregation and Glanzmann's thrombasthenia. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with integrin beta 3 expression, such as tumour formation, inflammation infections and the diseases mentioned above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense compound that inhibits human integrin beta3, useful e.g. for treating or preventing infection, inflammation and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell comprises: (a) obtaining the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction property. The method uses reverse transcriptase polymerase chain reaction cylone family. Sequences AA217803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ð
                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. ABC00010-ABF99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligoners described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cortral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at
central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDF). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                  Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, ERR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropojetin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/Or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
 useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                               factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP).
Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                    The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDF). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of exprince of the repression of sense involved in the production of exprince of the representation of sense involved in the production of the representation of sense involved in the production of the representation of sense involved in the production of the representation of sense involved in the production of the representation of sense involved in the production of the representation of the represe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EASA/COUB-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP).
                                                                                                                                                                                                                                                                                                                 Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

           New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying new catalytic nucleic acid that modulates selected processes especially ribozymes that cleave Raf RNA for treating cancer, restences, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.
                                                                                                                with tumour suppression or regression, apoptosis or virus resistence. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                   sequence represents an isolated nucleic acid sequence associated

Comprises: (a) introducing into the system. The method capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method capable of introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (BD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDB in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific acid, particularly for treating systemic diseases caused by specific acid, particularly for treating systemic diseases caused by specific acid, particularly for treating systemic diseases caused by specific acid, particularly for treations in diseased calls and to determine or araf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or consition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. AAV99922 to AAV93877 repression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CART Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```
Genotypic classification of bacteria, useful e.g. for diagnosis, based on variations in the sequence of the gyr and par genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method for genotypic classification of genes gyra, and is based on the sequences of parts of at least one of the genes gyra, gyrB, parc and parE, and comparison with known sequences of these genes. The method is used to identify bacteria, including differentiation between subspecies, for analytical or diagnostic dussification, e.g. in epidemiological studies and for detection of quinolone-resistance mutations. The specified genes are (almost) universally present in bacteria; show stable sequences variations; are identical within a given strain; show smaller variations between strains of a species than between species; contain species-specific variations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genotypic classification; gyrB; gyrB; parC; parE; diagnosis; detection;

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The cothat of Patched, and is a potential tumour suppressor. HTPL gene was important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, seletal muscle or colon function. HTPL proteins and nucleic acids are

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 17 BP; 4 A; 5 C; 2 G; 6 T; 0 U; 0 Other;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's saccoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, cundurangle and the stains, Sturge neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca cunder syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment. The method comprises the use of one or more therapies conditions suitable for the treatment in conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of of the the cell with (I). (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNA, in the presence of advalent confice the presence of ERG RNA in a cell. (I) is useful for specifically cated to the expression of ERG fusion genes. ARK1314-ABK2219 represent nucleic acide, including antisense and cargamatic nucleic acide molecules which regulate expression of ERG, and cargamatic nucleic acide molecules which regulate expression of ERG, and cargamatic nucleic acide invention

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, the covascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca unigaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge wulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge wulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or cell, by contacting (I) is useful for reducing ERG activity in a cell of its useful for sequence of a divadent confice such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, hammerhead ribozyme, cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanom; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; encovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port. wine stain; wound healing; sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; osler-weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;
